

What makes a gutter vacuum powerful?

Many vacuums on the market are either quick sprinters or strong weightlifters, it's rare that you'll get a machine or system that can do both. But why is that?

AIR FLOW AND WATER LIFT

Air flow and water lift are the two elements that come into play when it comes to developing a vacuum.

AIR FLOW

Force that transfers light debris through the poles

The quicker the air flow, quicker the transfer

WATER LIFT

Force that holds an object at the end of the poles

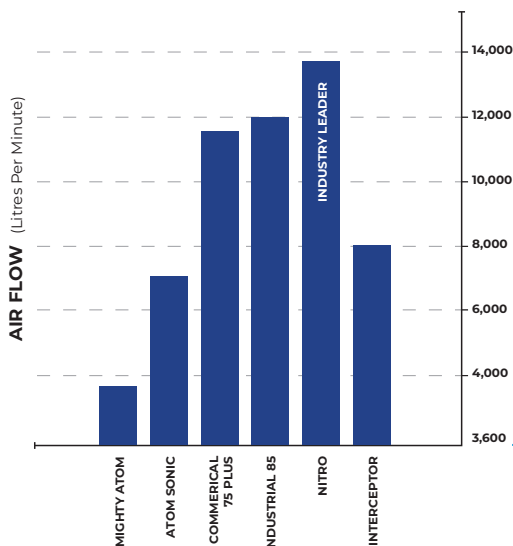

The higher water lift (inch) the heavier the object that can be lifted

2 dynamics within all vacuums

Very few gutter vacuums have the capacity to deliver both high air flow and water lift at the same time.

Our skyVac gutter vacs are the exception to this rule, each are individually engineered to deliver both maximum air flow and water lift.

Base line of both graph indicate the professional sector standard for Water Lift & Air Flow
